

# Hemispheric asymmetries in fronto-parietal networks underlying attentional control

Citation for published version (APA):

Duecker, F. (2013). *Hemispheric asymmetries in fronto-parietal networks underlying attentional control*. [Doctoral Thesis, Maastricht University]. Maastricht University. <https://doi.org/10.26481/dis.20131122fd>

## Document status and date:

Published: 01/01/2013

## DOI:

[10.26481/dis.20131122fd](https://doi.org/10.26481/dis.20131122fd)

## Document Version:

Publisher's PDF, also known as Version of record

## Please check the document version of this publication:

- A submitted manuscript is the version of the article upon submission and before peer-review. There can be important differences between the submitted version and the official published version of record. People interested in the research are advised to contact the author for the final version of the publication, or visit the DOI to the publisher's website.
- The final author version and the galley proof are versions of the publication after peer review.
- The final published version features the final layout of the paper including the volume, issue and page numbers.

providing details and we will investigate your claim.

**Hemispheric Asymmetries in Fronto-Parietal Networks  
Underlying Attentional Control**

- 1 Transcranial magnetic stimulation (TMS) over right and left frontal eye field specifically impairs voluntary shifts of spatial attention.
- 2 The right frontal eye field mediates attention shifts to both hemifields whereas the left frontal eye field mediates attention shifts to the contralateral hemifield.
- 3 Localization of TMS target points based on functional group data can be improved by using whole-brain alignment schemes that exploit curvature information of the cortical surface.
- 4 The auditory and somatosensory side effects of TMS influence behavior dependent on the experimental task, time point of stimulation, and stimulation site.
- 5 TMS experiments require strict control conditions that should be based on empirical knowledge rather than untested assumptions.
- 6 TMS applied to the healthy human brain can provide valuable insights into the functional deficits observed after brain damage and vice versa.
- 7 When two competing theories cannot be falsified for decades, chances are that they somehow both turn out to be true.
- 8 Investing time in sound psychophysics is indispensable.
- 9 Most experiments simply don't work out. Does anybody know why?

Felix Dücker
